Bembino

Welcome to Bembino

Bembino is a brand new digital font, based on the “Bembo” font produced by Aldus Manutius and in use in the 1490’s. The characters are drawn from the examples in the 1988 edition of *An Atlas of Typeforms* by James Sutton and Alan Bartram, with a few changes to make it more legible for modern readers.

This document shows the glyphs that are available in the latest release of the full font. The current range of glyphs is suitable for setting texts in English and most Western European languages based on the Latin alphabet. The font may also be used to set Greek, both modern and polytonic, and the Russian subset of the cyrillic languages, Hebrew, including masoretic texts, and Egyptian Arabic. It does not include the full range of presentation forms for all Arabic languages.

Bembino is a free font. It is, however, the copyright of the Research Group on Manuscript Evidence, to prevent someone from taking the font and selling it for money.

Why build yet another font?

With thousands of fonts available, the vast majority of them being free, why should anyone consider building yet another font? There are two reasons that led to the development of Bembino.

The first is that quantity does not bring quality. Probably only 1 font in 1,000 of those on the internet are usable for anything more than a few lines of text or a heading in a poster. Most have only one style, and one weight, and lack the essential characters needed for proper typesetting.

At the other extreme are the commercial fonts. These are designed for professional use and come in all needed weights, styles and variants with upwards of a thousand glyphs in each. However, they also come with a hefty price tag, and numerous restrictions. The second reason is that it is impossible to extend their character sets by adding new glyphs into the font without running the risk of being accused of unlawful copying.

There are similar efforts being made by others to develop high-quality fonts with extensive coverages. Two shining examples are Junicode, which concentrates on Western-European characters over many centuries, and the Code2000 project which is building a ‘full’ unicode font, but in a single style.

Bembino aims to fill the gap between these efforts by concentrating on very high-quality glyphs in multiple weights and styles. It will never cover the full unicode set (which includes Chinese ideographs, the Korean syllabary, Devanagari with all its presentation forms and so on) but the glyphs that it does offer will be usable and harmonious.

Why now?

For many years, digital font design has been hampered by competing formats, and only a slow acceptance that more than 256 glyphs might be needed at any one time. The first real step towards open font standards came in 1990 when Adobe Systems Incorporated published the Adobe Type 1 Font Format. Although the format had been decoded earlier, this was the first time it was possible to produce high-quality PostScript fonts without using either an undocumented format, or expensive commercial tools.

The main drawbacks of Type 1 fonts are the limitation of only 256 active glyphs at any one time, and the separation of the outlines from the font metrics in two separate files. The TrueType font specification, which appeared only a few years later merged the outlines and metrics into a single file, and supported up to 65,536 glyphs in a single font. However, TrueType has a less powerful curve-drawing model than PostScript and a very difficult raster-hinting mechanism (compared to Type 1 and its successor, Type 2).

These various issues were resolved around 2001 with the definition of OpenType, which is a wrapper for both Type 2 and TrueType fonts in a single file. Using OpenType, the metric, kerning and glyph substitution tables are contained in the same file as the PostScript Type 2 outlines, so offering the best of both worlds.

OpenType also supports multiple languages and sets of stylistic variations within a single language.

Two other factors that help support high-quality typesetting are the continued expansion of the Unicode standard to provide fixed encoding for known glyphs; and the appearance of layout software that can use the wide range of layout tables in an OpenType font. Again, Adobe is leading the way with InDesign. Usually, better-quality printed output will be generated from professional typesetting programs, as opposed to using Word- or Text-processing software intended only for office applications.

Why Bembo?

Quite simply, Bembo is one of the most beautiful fonts ever devised. It builds on the earlier 'Venetian' designs of Nicholas Jenson, but with the much lighter color than comes from a more open font. The upper-case letters sit slightly shorter than the lower-case ascenders and the height of the non-ascending lower-case letters is lower than the 'newspaper' fonts like Times New Roman, which contributes to the clear open look of the type, even when set tightly on the page. These design elements are carried through into the language extensions and the Greek and Cyrillic letter forms.

Each glyph is individually recognisable, with no confusion between lower-case l, upper-case I and digit 1, or upper-case O and digit 0. This is aided by the serifs which help separate the individual glyphs, without being obtrusive or distracting. Compared to the later fonts of Garamond or Caslon the serifs are simple, with flat feet and gentle curves into the ascenders. Both of these features translate well into outlines for modern laser printers.

Bembino is not an exact copy of Bembo. In the original design, the italic 'g' was a slanted form of the roman, which is hard to distinguish in isolation. Bembino uses a g based on the (later) Perpetua. The original italic 'y' retained a footed serif, and this was replaced with a y from an earlier Jenson font. The only other noticeable changes are the replacement of old-style numerals with more modern lining numerals, to avoid confusion with lower-case o and small-caps i or o, and the use of a full-height question mark. Apart from those changes the outlines are as close to the illustrated forms as we can make them.

Copying and Copyright?

Is it legal to copy, or to copyright, a font? The answer is yes to both questions. It is not possible to copyright the shape of an individual letter (you cannot claim copyright over 'the letter e' and make people pay whenever they use it). You *can* copyright the means to generate the shape of a letter 'e', just as you can copyright a specific method to place windows on a computer screen.

There are many fonts available named Bembo, including commercial fonts, with shapes similar to Bembino. Letter shapes from other fonts inspired the cursive and fraktur styles. Although Bembino resembles these letter forms, it is a brand new font developed without copying any existing font program.

Bembino is a copyrighted font program which embodies a method of generating letter outlines by means of a computer apparatus. You may not take that program and claim it as your own work, nor may you sell the program, either on its own or as part of a font package.

However, the Research Group on Manuscript Evidence grants you otherwise unrestricted use of the output of the Bembino program, for both private and commercial purposes. You may use the font to typeset a book which you sell for a profit. You may also embed the font program in a PDF file for which you charge a fee to download.

The Research Group on Manuscript Evidence does not require any licensing, downloading or shareware fees for using Bembino. An acknowledgement in a colophon, or elsewhere, would be appreciated, and donations to the Group are always welcome. The Research Group mission is described on our website, which also contains details of the methods for making donations. In many cases, donations may be fully tax-deductible.

What's in the font?

Bembino comes in three styles: regular, italic and cursive, and five weights (normal, medium, halfbold, semibold and bold). There is also a separate single-weight file containing a Fraktur style. Examples of the styles and weights are shown on page 18 of this booklet. The three main styles contain different sets of glyphs as shown in the font tables, starting on page 19. All contain the basic ASCII upper- and lower-case letters. The regular and italic also contain numbers, punctuation

Book Title Page

Chapter Title

Section Heading

Subsection Heading

Inline heading within running text

Examples of Headings using varying font styles and weights

and a set of small-capitals. They also contain the presentation forms for ff, fi, fl, ffi, ffl, and fj and a range of quotation marks for various styles of typesetting.

Usage Guide

The section offers some suggestions from the designer for how these fonts might be used. The first (and only?) rule of typography is to set what looks right on the page. Certain disciplines, such as mathematics and linguistics, have their own rules for use of bold, italic or small-caps, but for general text-layout the following guidelines may be helpful.

The bold and italic fonts are designed for maximum contrast with the regular, when used inline at the same point size. Usually, one or other of these two styles is used to provide emphasis. The choice of which to use may be determined by other factors (such as using italics for quotations or inline references), but the choice should be consistent throughout the document.

The italic font is suitable for setting more than one line of text (for example poetry) but modern readers may find it harder to read large blocks of italic as compared to the regular style. The bold font is not designed primarily for setting long blocks of text, it will be harder to read than using a lighter weight.

The intermediate weights are good for setting headings and titlings. Despite the defaults of some word

processors, it is quite reasonable (and, before the advent of bad Desk-Top Publishing, normal) to use only a single font within a document. The general rule for good legibility is that the larger the point size the less weight in the font. Setting titles in 36pt full-weight bold makes title pages look like ‘posters’ rather than the opening pages of books. However, it is important that headings are easily located and well-separated from the main text.

A well-chosen set of weights and sizes will not require any alternation between roman and italic styles for the headings. The semantics of italics does not need to be ‘inverted’ arbitrarily for headings at some levels and not others. The following set of suggestions may help set the standard for other documents.. The examples are shown in the displayed area above.

The “Book Title Page” is set in 36pt Regular, and shows very well the open nature of the font characters.

The “Chapter Title” is set in 24pt Medium. This gives a similar visual weight as the larger size set in Regular.

The other three headings are designed for a body size of 11pt, and would need to be increased slightly for larger body text. The “Section Heading” is 16pt Halfbold and the “Subsection Heading” is 13pt Semibold. The inline heading demonstrates the strong contrast between Regular and Bold when set at the same point size (11pt).

Inline heading consume minimal space, and yet can easily be distinguished from the text that immediately follows it.

Another other option for titles is to use capitals and small-caps, for example INTRODUCTION, PREFACE and so on. It provides good visual contrast without increasing the font weight and is less obtrusive than using all capitals. This style is good for running headings, since it does not detract from the main text. Small-caps are also less distracting when used for abbreviations in running text, compare 400AD with 400AD.

Not all features and styles have to be used, of course. For typing a simple letter, only the regular style at a single point size may be needed, since the message should be carried by the text, not by the layout. Basic word processing may also need italic, and one of the heavier weights for a single level of heading. A more complex document with more than one section-level could look better with both half-bold and full-bold in a three-weight configuration. Finer- grade typography and typesetting can bring in the other weights to maintain the right color on the page, as needed.

Text set significantly smaller than the main point size may be easier to read in medium rather than regular. This will depend on the printing technology and the quality of the paper. Based on the design parameters of the font, an increase of weight may be needed at point sizes below 8pt on a 600 d.p.i. laser printer if the serifs are to be accurately retained.

What is “Good Typesetting”?

Many factors combine to produce a layout that is easy to read, visually appealing and conveys the intended meaning. The features and capabilities of a font, beyond the range of glyphs it supports, can all help improve the quality of the final product.

Kerning & Presentation Forms

Some pairs of glyphs do not look good when set side-by-side. One example is the pair ‘V’ and ‘A’ which appear too far apart, and may lead the reader to think there is a word-space between them. In such cases, the inter-glyph spacing must be adjusted to bring the glyphs closer together, as in “VA”. This process is called kerning, and Bemino contains sets of tables to provide the correct kerning data.

Another example is the pair ‘f’ and ‘i’. In this case, the dot on the i overlaps the overhang on the f, producing an awkward ‘blob’ that distorts the overall color (weight) of the font. Using kerning to increase the space between the glyphs does not help, since that then creates too much space at the base of the characters. The solution in this case is to use a special ‘presentation form’ of the pair, “fi” which retains the correct spacing at the base of the glyph without producing the heavy blob. Such forms are often misnamed “ligatures” from an old printing term. The term presentation form emphasises that the alternate glyph is purely for presentation on the page, the textual content retains the two (or three) letters, for example when performing automated spelling checks.

Digraphs

Digraphs are the opposite case to presentation forms. There are two cases, one is where a pair of letters appears as a single glyph, and is stored and processed as a single glyph, or example æ and œ. Typesetting systems lacking the correct glyphs may be able to present only ‘ae’ and ‘oe’. The second case is where what appears to be a pair of letters is treated as a single character, for example “j” used as a single letter in Dutch.

Diacritical Marks

These are often termed ‘accents’, but the more general term is a diacritical or combining mark. There are four main places where such marks are used. The most frequent is the traditional ‘accent mark’ which is an essential feature of a particular language (schon and schön have completely different meanings in German). Bemino provides a range of pre-formed combinations, as opposed to building the form ‘on the fly’ by overprinting a base and accent. Using the correct glyph (i.e. Unicode code-point) allows typesetting programs to sort, check and format the language correctly.

The second most common use of diacritical marks is to indicate stress or tone. Stress marks usually indicate an exception to a language’s normal rule, as with *perchè* in Italian, with its non-standard stress on the final syllable. Chinese pinyin uses a set of marks to indicate the tone quality of a syllable: *mā*, *má* and *mà* all represent different tones, and different words.

The third use of marks is to indicate meter in poetry, marking long and short vowels.

The final place where marks occur frequently is in typesetting mathematical texts. Unlike languages there are few, if any, restrictions of which marks can appear over, under, or around which glyphs. For example $\ddot{\mathbf{u}}$ represents the second derivative of the vector \mathbf{u} with respect to time. Constructing the forms required for mathematics is usually best left to an equation editing system that can compose the glyphs in the correct sequence. Unlike language typesetting, there is not the same requirement for spelling, grammar and semantics checking in mathematical formulæ.

Sequential Forms

Certain scripts use different forms for the letters depending where they appear in a word. In general there are four identified classes of letter positions:

- Initial forms: at the start of a word.
- Medial forms: in the middle of a word.
- Final forms: at the end of a word.
- Isolated forms: when the letter stands alone.

Unlike presentation forms, the sequential forms do not depend on the letters around them, only their position within the word. There are, of course, some exceptions, for example the use of ‘isolated’ alif rather than ‘initial’ alif when following by particular letters in arabic. Bemmino has the appropriate glyphs for final forms in Greek, Hebrew, and Arabic, and the tables for a typesetting programming to access them.

Why are there no opticals?

“Optical” fonts are outlines that have been adjusted for use at a specific point size, or range of point sizes. They are intended to compensate for the fact that linearly-scaled fonts appear darker at larger point sizes, and lighter at smaller point sizes. Hence, by slightly thinning or thickening the strokes they create the ‘optical illusion’ of a consistent color on the page. While this is indeed the effect, the real value of optical variants is unclear. Since an optical variant is usually specified over a narrow range of point sizes (say from 11pt to 14pt), most documents end up using each optical only once (it is rare to find both 12pt and 13pt type in the same document). This turns into a four-fold increase in the size of the font pack used in a document, for little real gain in legibility or appearance.

Bemmino offers instead more weights than are usually found, and the effect of an optical font can be gained by a good choice of weight for the font size and purpose. These aspects are discussed in the “Usage Guidelines” above.

Why are there separate small caps?

Producing the effect of small-caps by simply scaling the capitals of the main font may produce an acceptable result. It works with Bemmino (the scale factor is exactly 70%), but the resulting glyphs may appear rather too light on the page at normal point sizes. The small caps are designed to have slightly darker color than the equivalent scaled caps and blend in better at point sizes below about 36pt. This is particularly noticable in the italic fonts.

One advantage of dynamically mapping smallcaps (using OpenType features) is that searching for “The” will also match “THE”. There are no separate presentation forms for small caps fi or fl (etc.) since they are exactly the two glyphs of the original pair of characters (FI or FL).

What language is that?

Bemmino is a multi-lingual font. It can be used to typeset most European languages, Greek, Hebrew, Arabic, and the Russian languages that use Cyrillic. As a result, there are a number of similar glyphs in the font.. Latin, Greek and Cyrillic all have glyphs that look like A, B, E, O, P but with different pronunciations. However, Latin ‘C’ looks too wide in russian, and Latin ‘M’ with sloping sides is distracting to a russian-born reader.

In those cases where a similar glyph distracts from legibility, Bemmino uses forms appropriate to the particular language, even for similar glyphs. However, they do occupy different code points and a typesetting program should use the correct code-point for the language being typeset. This allows the correct kerning and hyphenation rules to be applied for that language. In general, there is no way to infer language from the printed form. If a particular glyph appears in a text (e.g. Ł) then the Unicode tables can be consulted to infer that the word is probably Polish.

Special Character Positions

Some glyph positions in the font contain special characters that are represented by short names in the font tables. These glyphs do not appear literally as shown in the tables, but have the following meanings.

sp (<0020>). The space character. Produces no visible mark on the page. May be considered as a potential line-breaking point when typesetting..

nbsp (<00A0>). Non-breaking space character. Unlike **sp**, this cannot be considered as a line-breaking point.

shy (<00AD>). Soft-hyphen. Appears as a hyphen if a line is broken at that point, otherwise occupies no space on the page.

nqsp (<2000>) and **ensp** (<2002>). En-quad and en-space. A space one-half the width of an em-space.

mqsp (<2001>) and **emsp** (<2003>). Em-quad and em-space. A space equal to the type size in points..

3msp (<2004>). One-third of an em-space.

4msp (<2005>). One-quarter of an em-space

6msp (<2006>). One-sixth of an em-space.

fsp (<2007>). Figure space. The width of a digit glyph.

psp (<2008>). Punctuation space. The width of a narrow punctuation glyph.

thsp (<2009>). Thin space. One-fifth of an em-space.

hsp (<200A>). Hair space. The thinnest space available in the font.

zws (<200B>). Zero width space. Usually occupies no width, but may expand if a line is justified.

zwj (<200C>) and **zwnj** (<200D>). Zero-width joiner and non-joiner. Used for glyph combinations.

lrm (<200E>) and **rlm** (<200F>). Left-right and Right-left marker. Used to switch directions for Hebrew and Arabic texts.

The Nature of the Glyphs

The diagram above shows three of the roman regular-weight glyphs in outline form, with the spacing as they would appear if set as “Vel” in normal text. The diagram illustrates some of the main design features of Bembo.

Obviously, the glyphs contain serifs (the extensions at the top of ‘V’ and the foot of ‘l’). Unlike a sans-serif font, serifs provide clear demarcations for the end of strokes. By varying the serif forms it is possible to distinguish ‘I’, ‘l’ and ‘1’, which are often confused in sans-serif fonts (for example Helvetica). Serifs also aid the eye in grouping letters into words, since they provide visual continuity at the baselines of most words.

The serifs are simple, with a flat top, or bottom, and are equally weighted to either side of the glyph. The serifs also have vertical sides. All these features aid in maintaining a consistent appearance across multiple glyph sizes, avoiding unnecessary distinctions that draw the eye away from the main glyph shape and therefore slow reading.

The curve of the ‘e’ at the base of the bowl descends below the baseline on which the ‘V’ and ‘l’ sit. This produces an ‘optical illusion’ that the ‘e’ is actually on the baseline. If the base of the bowl merely sits on the baseline, it appears too high when printed. The top of the ‘e’ extends slightly above the top of an ‘x’ for the same reason.

The height of the tall lower-case letters exceeds that of the upper-case (capital) letters. This design feature is usually attributed to Aldus Manutius, and is often termed ‘Aldine’ capitals. This subtle effect improves the legibility of the lower-case letters, and slightly reduces the impact of the capital letters, making them stand out less on the page.

The diagram illustrates the effect of kerning between the ‘V’ and the ‘e’. Without adjustment the ‘e’ would sit only to the right of the end of the ‘V’, introducing a space almost as wide as a letter-space and destroying the visual grouping of the letters into a word. By reducing the space between ‘V’ and ‘e’ at the centerline of the ‘e’ to match the space between ‘e’ and ‘l’ the continuity is restored.

For most typesetting, the distance between the bottom of the ‘y’ and the top of the ‘l’ is the tightest (smallest) interline spacing that can be set without overlapping. This distance is slightly less than the font design size, so it is possible to set 12pt/12pt (12pt font on 12pt linespacing), though the result is very dense on the page.

Certain glyphs will exceed that distance, specifically accented capitals (Å, É etc.). Setting texts with accents requires approximately 20% more interlinear spacing, or leading, to avoid overlapping lines. Setting Arabic with full vowel markings requires about 50% more interline spacing.

Technical Details

The Bemmino Font Family comprises 16 font files. There are 5 Regular (upright, Roman) files and 5 Italic files. These styles all appear under the name Bemmino when loaded into a typesetter. Since cursive and fraktur are not defined font styles, the remaining 6 font files appear under a different font names. The 5 cursive weights are called Pietro (after the archbishop who commissioned the original font) and the single fraktur font appears as Frangelico (a small pun on fraktur) in a font listing.

Bemmino is usually distributed as a single compressed directory (.zip file) containing all 16 fonts. To install the fonts on a PC running Windows it is usually simply enough to copy the files from the zip archive into the WINDOWS/Fonts directory on the main hard-drive. Windows-7 users can use the install option of the Font Manager to copy the files.

If you have installed a previous version of Bemmino on a Windows machine, you will have to delete the old version before you can install the new one, since Windows will not automatically overwrite font files. Once installed, the font names should appear in the Font Dialog boxes or pull-down menus for most text processors (for example Microsoft Word) or typesetting software (for example Adobe InDesign).

Bemmino is designed for printing on laser printers using a minimum of 300 print dots per inch, not for screen display. Because of the way Windows chooses to display non-TrueType fonts, especially in combination with the Microsoft Cleartype system, you may notice artefacts when displaying Bemmino on-screen. Typically these appear as shadows on verticals, uneven weight in sloping lines or even false colors at the edges of the glyphs. None of these artefacts will be present in the final output, particularly if you are able to export and print using PDF, rather than using the Windows print function.

Bemmino is written in the input language of the Outline Font Editor component of ResearchDesk. ResearchDesk is a toolkit of document management systems being developed by the Research Group on Manuscript Evidence. The box on the right shows the part of the program that generates the letter 'l' in the Regular font (as displayed on the previous page).

The outline Font Editor translates the commands into Adobe Type-2 charstring operations and OpenType Font tables according to the published, and public, specifications for these systems. This process generates the sixteen .otf files in the Bemmino distribution.

Further details of the font program and the design parameters (stem widths, serif construction etc.) are available from the RGME for anyone who is interested in working with Bemmino at the font design level.

Sample Texts

The following pages contain sample texts to illustrate the different scripts and languages for which Bemino has been designed.

The first page shows the opening paragraph of *The War of the Worlds*, written by H.G. Wells and published in 1898. The text is set in Regular, Italic and Cursive styles at the same weight and point size.

The second pages gives examples of transcribed speech using glyphs from the International Phonetic Alphabet. These are short extracts taken from *An Introduction to the Pronunciation of English* by A.C. Gimson (4th ed. 1989, published by Edward Arnold).

The next two pages show ancient Greek, in both the upright and italic fonts. The text is taken from the opening of Book 4 of Aristotle's *Historia Animalium*, or "The History of Animals" (Τὼν περὶ τὰ ζῷα ἱστορίων). It demonstrates the wide range of polytonic marks required to set ancient Greek.

The next two pages show modern Russian, in both the upright and italic fonts. The text is taken from a learner's edition of "Taman: A small town on the Black Sea" (Тамань: маленький городок на берегу моря) a short story by Mikhail Lermontov contained within his novel *A Hero of Our Time* (Герой нашего времени) written in 1839 and revised in 1841. Other than the simplified vocabulary, the learner's edition also includes the stress marks over the vowels, which would not be required for native readers. This is demonstrated on the following page, which shows the classical edition, in cursive script

The next page shows three small examples of other scripts, an extract from the New Testament in Old Armenian (from the Zohrab Bible); some of the runes from the Franks Casket in the British Museum; and part of a newspaper article in modern Thai.

The next page is in Hebrew, the opening of the Book of Genesis in the Hebrew version of the Bible, entitled *Berashit* (בראשית) "In the Beginning". The text is taken from *Holy Scriptures of the Old Testament, Hebrew and English* (British & Foreign Bible Society, London 1985)

and demonstrates the use of the masoretic vowel marks as well as the cantillation marks and their combination.

The final page shows a sample of Arabic typesetting. The text is the opening Surah, الفاتحه "Al Fatihah (The Opening)" of the Koran.

Although these samples are all monolingual, Bemino is designed to enable texts requiring different scripts to be set inline in their native scripts with consistent weights, heights, and font color, as demonstrated by the previous paragraphs on this page. This accords with the principles of design and text layout as described and demonstrated in the "Style Manifesto" published in *ShelfLife*, Number 1, Winter 2006 (ISSN 1528-7971), the illustrated Bulletin of the Research Group on Manuscript Evidence.

The Eve of the War

No one would have believed in the last years of the nineteenth century that this world was being watched keenly and closely by intelligences greater than man's and yet as mortal as his own; that as men busied themselves about their various concerns they were scrutinised and studied, perhaps almost as narrowly as a man with a microscope might scrutinise the transient creatures that swarm and multiply in a drop of water. With infinite complacency men went to and fro over this globe about their little affairs, serene in their assurance of their empire over matter. It is possible that the infusoria under the microscope do the same. No one gave a thought to the older worlds of space as sources of human danger, or thought of them only to dismiss the idea of life upon them as impossible or improbable. It is curious to recall some of the mental habits of those departed days. At most, terrestrial men fancied there might be other men upon Mars, perhaps inferior to themselves and ready to welcome a missionary enterprise. Yet across the gulf of space, minds that are to our minds as ours are to those of the beasts that perish, intellects vast and cool and unsympathetic, regarded this earth with envious eyes, and slowly and surely drew their plans against us. And early in the twentieth century came the great disillusionment.

The Eve of the War

No one would have believed in the last years of the nineteenth century that this world was being watched keenly and closely by intelligences greater than man's and yet as mortal as his own; that as men busied themselves about their various concerns they were scrutinised and studied, perhaps almost as narrowly as a man with a microscope might scrutinise the transient creatures that swarm and multiply in a drop of water. With infinite complacency men went to and fro over this globe about their little affairs, serene in their assurance of their empire over matter. It is possible that the infusoria under the microscope do the same. No one gave a thought to the older worlds of space as sources of human danger, or thought of them only to dismiss the idea of life upon them as impossible or improbable. It is curious to recall some of the mental habits of those departed days. At most, terrestrial men fancied there might be other men upon Mars, perhaps inferior to themselves and ready to welcome a missionary enterprise. Yet across the gulf of space, minds that are to our minds as ours are to those of the beasts that perish, intellects vast and cool and unsympathetic, regarded this earth with envious eyes, and slowly and surely drew their plans against us. And early in the twentieth century came the great disillusionment.

ТАМАНЬ

I. ГОРОДОК НА БЕРЕГУ МОРЯ

Тамань — маленький городок на берегу моря. Я думаю — это самый маленький и самый бедный из всех городов Росси. И самый непритный. Грязно, бедно в Тамани: грязные улицы, старые заборы вдоль улиц, дома — маленькие бедные. Во всем городе только один каменный дом, у самого въезда в город. В нём почта и военное начальство. Все другие дома в Тамани — не дома, а маленькие избушки.

Однажды, поздно ночью подъезжаю на тройке к Тамани. Я очень устал и голоден. Я уже много, много дней в дороге. Меня посылает моё военное начальство на Кавказ. Моя усталая тройка въезжает в город и останавливается у каменного дома. Я начинаю стучать. Стучу очень долго. Наконец, слышу голос:

«Кто идёт?»

«Я офицер. Меня посылает военное начальство на Кавказ. Я завтра еду дальше. Мне нужна квартира на ночь.»

Из дома выходит казак, унтер-офицер. Снова:

«Кто вы? Что нужно?»

«Я офицер. Еду на Кавказ. Я много дней в дороге и очень устал. Мне нужна квартира на ночь. Хочу завтра ехать дальше.»

Казак ведёт меня по городу. Мы останавливаемся у каждой избушки, у каждого самого бедного домика. Стучим. Просим. Но квартир в городе нет.

ТАМА́НЬ

I. ГОРОДО́К НА БЕРЕГУ́ МО́РЯ

Тамáнь — ма́ленький городо́к на берегу́ мо́ря. Я ду́маю — э́то са́мый ма́ленький и са́мый бе́дный из всех городо́в Росси́и. И са́мый неприятный. Грязно, бе́дно в Тамáни: грязные у́лицы, ста́рые забо́ры вдоль у́лиц, дома́ — ма́ленькие бе́дные. Во всём го́роде то́лько оди́н ка́менный дом, у са́мого въ́езда в го́род. В нём по́чта и во́енное нача́льство. Все дру́гие дома́ в Тамáни — не дома́, а ма́ленькие избу́шки.

Одна́жды, по́здно но́чью подъезжа́ю на тро́йке к Тамáни. Я о́чень уста́л и го́лоден. Я уже́ мно́го, мно́го днѐй в доро́ге. Меня́ посыла́ет моё во́енное нача́льство на Кавка́з. Моя́ уста́лая тро́йка въезжа́ет в го́род и оста́навливается у ка́менного до́ма. Я начина́ю сту́чать. Сту́чу о́чень до́лго. Наконе́ц, слы́шу го́лос:

«Кто идёт?»

«Я офице́р. Меня́ посыла́ет во́енное нача́льство на Кавка́з. Я за́втра еду́ да́льше. Мне нужна́ кварта́ра на́ ночь.»

Из до́ма выхо́дит каза́к, у́нтер-офице́р. Сно́ва:

«Кто вы? Что ну́жно?»

«Я офице́р. Еду́ на Кавка́з. Я мно́го днѐй в доро́ге и о́чень уста́л. Мне нужна́ кварта́ра на́ ночь. Хочу́ за́втра е́хать да́льше.»

Каза́к веде́т меня́ по го́роду. Мы оста́навливаемся у ка́ждой избу́шки, у ка́ждого са́мого бе́дного до́мика. Сту́чим. Проси́м. Но кварта́р в го́роде нет.

Тамань

Тамань – самый скверный городишко из всех приморских городов России. Я там чуть-чуть не умер с голода, да еще вдобавок меня хотели уломить. Я приехал на перекладной тележке поздно ночью. Ямщик остановил усталую тройку у ворот единственного каменного дома, что при въезде.

Часовой, черноморский казак, услышав звон колокольчика, закричал спросонья диким голосом: «Кто идет?» Вышел урядник и десятник. Я им объяснил, что я офицер, еду в действующий отряд по казенной надобности, и стал требовать казенную квартиру. Десятник нас повел по городу. К которой избе ни подъедем – занята. Было холодно, я три ночи не спал, измучился и начал сердиться. «Веди меня куда-нибудь разбойник! хоть к черту, только к месту!» – закричал я. «Есть еще одна фатера, – отвечал десятник, почесывая затылок – только вашему благородию не понравится; там не чисто». Не поняв точного значения последнего слова, я велел ему идти вперед, и после долгого странствования по грязным переулкам, где по сторонам я видел один только ветхие заборы, мы подъехали к небольшой хате, на самом берегу моря.

Полный месяц светил на камышовую крышу и белые стены моего нового жилища; на дворе, обведенном огадой из булыжника, стояла избогась другая лачужка, менее и древнее первой. Берег обрывом спускался к морю почти у самых стен ее, и внизу с непрерывным ропотом плескались темно-синие волны. Луна тихо смотрела на беспокойную, но покорную ей стихию, и я мог различить при свете ее, далеко от берега, два корабля, которых черные снасти,

The Japanese Kana and Kanji glyphs are only available in the Regular.Normal style.

Font Tables

The following pages show the sets of glyphs available in each of the four font styles (Roman, Italic, Cursive and Other). Most of them are familiar upper-case, lower-case and small-caps glyphs, but some are designed to improve the appearance of pages when they are typeset. Each glyph is identified by its Unicode index number, in hexadecimal. Version 5.2 or above of the Unicode standard explains the purpose and use for all glyphs in the appendix.

Regular

Page 2 comprises the standard ASCII character set, and its extension into ISO8859-1 (Western-European languages), plus the latin presentation forms.

Pages 3 and 4 show the extensions for Eastern European and minor European languages, plus ‘wynn’ for Old English. Page 5 shows the non-composed diacriticals.

Page 6 contains the International Phonetic Alphabet, and Page 7 shows Armenian and Runes. The Runic section is still under development

Pages 8 and 9 contain the Greek alphabet, and the precomposed polytonic Greek forms.

Page 10 contains the Cyrillic alphabet and Page 11 the Hebrew alphabet.

Pages 12 and 13 show the Arabic glyphs, including all the presentation forms. Note that most of the ‘B’ set of presentation forms are omitted in this release.

Page 14 shows Thai and the continuation of the Kanji. Page 15 the Japanese Hiragana and Katakana forms. Page 16 contains the (small) subset of Chinese-Japanese Kanji contained within this release of Bemfino

Pages 17 and 18 contain various special characters and mathematical symbols, and the page 19, the last of this group shows, the small-capital forms of those letters that have explicit small-caps glyphs.

Italic

The second group of pages shows the glyphs in the italic font. Pages 20 and 21 show the ISO8859-1 ASCII forms and the Eastern European extensions. Pages 22 and 23 show the Greek and polytonic forms. Page 24 shows the Cyrillic and Thai alphabets and Page 25 shows the small-caps forms.

Cursive

Pages 26 and 27 show the available Latin and Cyrillic cursive forms in the ‘Pietro’ font.

Fraktur

Page 28 shows glyphs available in the ‘Frangelico’ font. this font is available in a single weight and style and contains glyphs for non-standard applications. Currently this set contains the Fraktur alphabet, used for some mathematical symbols, and for setting older forms of Germanic languages.
